*Perinatal Growth and Nutrition Sep 24 2020 "Preface Humans, like all mammals, have an inborn desire to nurture and suckle their young and the act of feeding is important for the bonding between mother and child. The birth of a critically ill*

preterm infant disrupts this, but for a mother, the use of her milk to feed her infant may be the most tangible role she has in the medical care of her critically sick child. Parents and caregivers see growth and feeding as important milestones first demonstrating increasing stability, then signaling the start of recovery, and finally showing readiness for discharge home. Despite our intuitive and emotional connection with growth, preterm infants grow poorly after birth and very commonly develop ex utero growth restriction (EUGR) or postnatal growth failure. There are many reasons for this including the associated medical conditions of prematurity, but inadequate nutrient intake plays a large part. This results both from technical difficulties in providing adequate nutrition, and from fears about the complications associated with doing so, including metabolic derangements such as hyperglycemia and hyperlipidemia, and diseases such as necrotizing enterocolitis. At the time of hospital discharge, many preterm infants are profoundly growth retarded, and their average weight is as little as 70% of that expected for their peers who were not born prematurely. Preterm infants show variable amounts of catchup growth after discharge, but typically remain smaller than the term-born peers throughout childhood and adolescence. This pattern of early growth restriction followed by variable amounts of catch-up growth has drawn parallels with the in utero growth restricted (IUGR), small-for-gestational age, infant"--Provided by publisher.

*Infant Mortality, Population Growth and Family Planning in India* Mar 11 2022 First published in 1972, this reissue deals with the crucial issue of population explosion, one of the most crucial problems facing the contemporary developing world. Written by a world-renowned demographer and family planning specialist, the book deals specifically with the Indian experience. Reviewing population change in India over the last century, Professor Chandrasekhar focuses on three key issues: the socioeconomic repercussions of reduced infant mortality in twentieth-century India; the rapid population growth from 1871 and its implications on India's efforts to raise her standard of living; and finally India's valiant efforts to promote family planning amongst her hundred million married couples.

Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1916 edition. Excerpt: ...and outside doors, if any, allowing the air to draw freely through for two minutes. Then close them and the same fire will soon make itself felt. This is because Oxygen is as important for fuel as for food. Count this as true, and how does it seem to sleep all night in a room where fresh air is carefully shut out? How about keeping a helpless child in the same room, so we may "feel sure

it is all right?" 51. The fear of "taking cold" may be profitably exchanged for the fear of being poisoned with bad air. Never be content to live in any room through a whole day without having the air changed several times. If there is in any house some one who thoroughly understands this, he has opportunities in plenty to safeguard the whole family. 52. Children, if possible, should sleep in a room by themselves, and always with an open window. Oxygen though so important as food is often overlooked because it does not cost money. Other kinds must be purchased and eaten. Because they cost money, everybody should understand what foods are most valuable. 53. All human bodies must be supplied by their food with proteids, carbohydrates and fats. A few foods contain all these in the right proportions. All other foods contain some of these necessary principles. 54. Milk, eggs, and whole wheat are the few foods which can be depended upon to supply all the wants of the body. Of these, milk is best adapted to a young child's needs, and wheat and eggs should be the first additional food when milk does not fully meet its demands for growth and forming teeth. 55. A variety of food is plainly called for by the fact that so many articles contain important elements, and as a child advances it should be taught to eat a wholesome...

*Nutrient Regulation during Pregnancy, Lactation, and Infant Growth Dec 08 2021*

Almost every aspect of energy and nutrient metabolism is altered by hormonal and other physiological changes during pregnancy and lactation. While it is evident that hormonal adjustments affect nutrient requirements, these are rarely considered when nutrient recommendations are made for pregnant or lactating women, and often neglected during evaluation of nutritional status. In addition, changes in nutrient metabolism during the stages of pregnancy and of lactation are usually considered separately, while in reality events during pregnancy can have a major influence on nutritional status and nutrient requirements during lactation.

The purpose of this volume is to describe changes in the metabolism of important nutrients during pregnancy and lactation, including the physiological basis for these changes and their implications for nutrient requirements and assessment. Authors have considered such issues as inter-relationships between endocrine changes and nutrient metabolism at the tissue, cellular and molecular level;

alterations in nutrient binding proteins; the efficiency of nutrient absorption and retention; and the impact on maternal as well as fetal nutritional status. Another unique aspect of this book is the focus on pregnancy and lactation as a continuum.
